GENERAL INFORMATION:
APPLICANT: Lynn Doucette-Stamm et al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCC
TITLE OF INVENTION: BPIDERAIDS FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERRACE: GTC-007
CURRENT APPLICATION NUMBER: US/09/134,001C
CURRENT FILLNG DATE: 1998-08-13
PRIOR APPLICATION NUMBER: US 60/064,964
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  APPLICANT: New York University

Patent No. 5389526
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Slade, Martin B
APPLICANT: Chang, Andy C M
APPLICANT: Williams, Keith L
TITLE OF INVENTION: Improved Plasmid Vectors for Cellular
TITLE OF INVENTION: Slime Moulds of the Genus Dictyostelium
NUMBER OF SEQUENCES: 19
CORRESPONDENCE ADDRESS:
ADDRESSE: Woodcock Washburn Kurtz Mackiewicz & No. 5389526ris
STREET: One Liberty Place 46th Floor

Patent No. 5801013
GENERAL INFORMATION:
APPLICANT: Tao, Jianshi
APPLICANT: Houman, Fariba
APPLICANT: Shen, Xiaoya
APPLICANT: Shen, Xiaoya
APPLICANT: Schimmel, Paul R.
TITLE OF INVENTION: Helicobacter Aminoacyl-tRNA Synthetase
TITLE OF INVENTION: Proteins, Nucleic Acids and Strains Comprising Same
NUMBER OF SEQUENCES: 67
CORRESPONDENCE ADDRESS:
ADDRESSEE: Hamilton, Brook, Smith & Reynolds, P.C.

                                                                                                                                                                                                          ö
                                                                              invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a Borrelia burgdorferi B313 protein. The present invention describes an isolated nucleic acid (I) that: (i) encodes a polypeptide fragment (II) immunologically reactive with rabbit polyclonal antibody raised against a 13 kDa polypeptide of Borrelia burgdorferi B313, but not reactive with most proteins from

                                                                                                                                                                                                                                                                                                                                                                          RESULT 2
                                                                                                                                                                                                                                                                                                                                                                                       AAY04278
```

```
to specific nucleic acid sequences but not to genomic DNA from most other spirochaetes. (I), (II) and transformed cells are useful in vaccines to protect against infection by B. burgdorferi sensu lato. (I), (II) and antibodies raised against (II) are used to diagnose such infections, in standard immunoassays or amplification/hybridization tests. (I) are also used to produce recombinant (II). The 13 kD protein is involved in virulence and is highly conserved within B. burgdorferi sensu lato, but is absent from other Borrelia species (e.g. those responsible for relapsing fever or avain borrelosis). It should provide a more specific and sensitive antibody response, and diagnosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  other spirochaetes; and/or (ii) hybridizes under stringent conditions

ö
can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a Borrelia afzelii ACAI protein. The present invention describes an isolated nucleic acid (1) that: (i) encodes a polypetide fragment (II) immunologically reactive with rabbit polyclonal antibody raised against a 13 kDa polypeptide of Borrelia burgdorferi B313, but not reactive with most proteins from other spirochaetes; and/or (ii) hybridizes under stringent conditions to specific nucleic acid sequences but not to genomic DNA from most other spirochaetes (I), (II) and transformed cells are useful in vaccines to protect against infection by B. burgdorferi sensu lato. (I), (II) and antibodies raised against (II) are used to diagnose such infections, in standard immunoassays or amplification/hybridization tests. (I) are also used to produce recombinant (II). The 13 kD protein is involved in virulence and is highly conserved within B. burgdorferi
                                                                                                                                                                                                                                                                       82 GIGLILAGAYLDIKALDGITKKAAFQWTWGKGVMLAGVVTMAVTRLTEIILPFTFANSYN 141

The present sequence represents a Borrelia garinii 1P90 protein. The present invention describes an isolated nucleic acid (1) that: (i) encodes a polypeptide fragment (II) immunologically reactive with cabbit polyclonal antibody raised against a 13 kDa polypeptide of Borrelia burgdorferi B313, but not reactive with most proteins from there spirochaetes; and/or (ii) hybridizes under stringent conditions to specific nucleic acid sequences but not to genomic DNA from most to specific nucleic acid sequences but not to genomic DNA from most ovaccines to protect against infection by B. burgdorferi sensu lato.

(I), (II) and antibodies raised against (II) are used to diagnose such infections, in standard immunoassays or amplification/hybridization fests. (I) are also used to produce recombinant (II). The 13 kD protein is involved in virulence and is highly conserved within B. burgdorferi sensu lato, but is absent from other Borrelia species (e.g. those
sensu lato, but is absent from other Borrelia species (e.g. those responsible for relapsing fever or avain borrelosis). It should provide a more specific and sensitive antibody response, and diagnosis, compared with use of whole bacteria as antigen.

The present invention describes an isolated nucleic acid (I) that: (1) encodes a polypeptide fragment (II) immunologically reactive with rabbit polychothal antibody raised against a 13 kba polypeptide of aborella burgdorferi B313, but not reactive with most proteins from ther spirochaetes; and/or (ii) hybridizes under stringent conditions to specific nucleic acid sequences but not to genomic DNA from most to specific nucleic acid sequences but not to genomic DNA from most conserved to protect against infection by B. burgdorferi sensu lato.

(I), (II) and antibodies raised against (II) are used to diagnose such infections, in standard immunoassays or amplification/hybridization tests. (I) are also used to produce recombinant (II). The 13 kD protein is involved in virulence and is highly conserved within B. burgdorferi sensu lato, but is absent from other Borrelia species (e.g. those responsible for relapsing fever or avain borrelosis). It should provide a more specific and sensitive antibody response, and diagnosis,
                                                                                                                                 7
responsible for relapsing fever or avain borrelosis). It should provide a more specific and sensitive antibody response, and diagnosis, compared with use of whole bacteria as antigen.
                                                                                                                                                                                                                           IGSFAQGDILGGSLILGFDAVGIGLILAGAYLDIKALDGITKKAAFQWTWGKGVMLAGVV 120

The present sequence represents a Borrella burgdorferi B313 N-terminal peptide. The present invention describes an isolated nucleic acid (I) that: (I) encodes a polypeptide fragment (II) immunologically reactive with rabbit polyclonal antibody raised against a 13 kDa polypeptide of Borrella burgdorferi B313, but not reactive with most proteins from other spirochaetes; and/or (ii) hybridizes under stringent conditions to specific nucleic acid sequences but not to genomic DNA from most other spirochaetes (I), (II) and transformed cells are useful in vaccines to protect against infection by B. burgdorferi sensu lato.

(I), (II) and antibodies raised against (II) are used to diagnose such infections, in standard immnoassays or amplification/hybridization tests. (I) are also used to produce recombinant (II). The I3 kD protein is involved in virulence and is highly conserved within B. burgdorferi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sensu lato, but is absent from other Borrelia species (e.g. those responsible for relapsing fever or avain borrelosis). It should provide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAF94145 to AAF94409 represent essential bacterial genes from Haemophilus influenzae, which encode the proteins given in AAB88492 to AAB88556. The present in also describes methods for identifying essential bacterial genes (i.e. those essential to the survival of a bacterium) using a transposition system. The methods are used to identify essential genes from bacteria, especially H. influenzae (which causes otitis media, meningitis and upper respiratory tract infections) which may be used as targets for potential antimicrobial agents.

AAF94410 to AAF94416 represent PCR primers used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Essential bacterial genes from Haemophilus influenzae and methods for identifying 'essential' genes that may be potential therapeutic targets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DILGGSLILGFDAVGIGLILAGAYLDIKALDGITKKAAFQWTWGKGVMLAGVVTMAVTRL 127

The invention describes an essential bacterial gene (I) comprising a purified polynucleotide isolated from Haemophilus influenzae where (I) is essential to H. influenzae survival. The encoded polypeptide (II) is useful for screening substances that function to inhibit essential H. influenzae polypeptides by contacting (II) with the desired substances and measuring the response by a screen from specific, enzyme, general, affinity, phenotypic and binding screen. (I) and (II) are useful in developing therapeutic agents such as antifungal, antibacterial and antiparasitic agent, insecticidal agent, and preventive antimicrobial agents which are effective in preventing microbial infection or useful in treatment of that particular infection: (I) and (II) may also be useful in treatment of mucous membrane infections such as otitis media, aniusitis, bronchitis, alveolitis, conjunctivitis, pneumonia, meningitis, epiglottis, celiulitis and septic arthritis. This is the amino acid sequence of an essential H. influenzae gene, described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ς.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   73 VKSFFGLSGDGKTAIIEMAAASGLHLVPPEKRNPLLTTSYGTGELIKLALDLGVESFILG 132

The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are
                                                                                                                                                                                                                                                                                                                                             Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         67 LPIFGLKTESNFFMYVKAPAAGVILATGFVHILPDATESLTSSCLGEEPPWGDFPM-TGL 125

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PER) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and continuous and sequences of the invention.

Note: The sequence data for this patent did not appear in the printed sequence in the printed and polymeration of electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                658 CLIESTRNSMDATNKAMLESVAAEMM----SVSDGVMRLPLFLAMILPVQLGAATADACT 713

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   δ
                      δy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PKB) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) and its binding antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forenaics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences of the invention.

Configuration, but was obtained in electronic format directly from WIPO specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .;

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and maniyabide the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, coryneform bacterium, and identifying a manion acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence data for this patent did not form part of the printed lication, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           69 RFGARMVLTGG----VLSALGNLSL-----LAFHD--GPSLLVGRFIVGLGV----- 110

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAF70984 to AAF71133 encode the Corynebacterium glutamicum stress, resistance, and tolerance (SRT) proteins given in AAB78871 to AAB79020. The C. glutamicum SRT genes (I) can be used in vectors (II) for expression in host cells and production of fine chemicals, such as, an organic acid, a proteinogenic or nonproteinogenic amino acid (preferred), a purine or pyrimidine base, a nucleoside, a nucleotide, a lipid, a saturated are or unsaturated fatty acid, a diol, a carbohydrate, an aromatic compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine chemical production can be modulated. The presence of (I) or the SRT proteins (III) encoded by them are used for diagnosing the presence
                                                                                                                                                                                                                              Corynebacterium glutamicum; stress; resistance; tolerance; SRT; fine chemical production; organic acid; proteinogenic amino acid; nonproteinogenic amino acid; purine base; pyrinidine base; nucleoside; nucleotide; lipid; saturated fatty acid; unsaturated fatty acid; carbohydrate; aromatic compound; vitamin; cofactor; polyketide; enzyme; evolutionary study; environmental hazard; fermentation.

cells containing them can be used to map the genomes of organisms related to C. glutamicum, to identify and localise C. glutamicum sequences of interest, in evolutionary studies, in determination of SRT protein aregions required for function, in modulating the SRT protein activity, and in modulating the SRT protein activity, and in modulating the SRT protein activity, end in modulating the SRT protein activity, end in modulating the SRT protein activity, end in modulating the srr pathway. (II) are used to permit C. glutamicum to survive in a environment that is normally environmentally or chemically hazardous to it. (I) and protein molecules encoded by it increase the survival of C. glutamicum to chemical and multiplication in large scale fermentative growth conditions. By increasing the growth rate or maintaining a normal growth rate in poor or toxic conditions, the yield, production and/or efficiency or production of fine chemicals from a culture may be increased.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                12;

AAF70984 to AAF71133 encode the Corynebacterium glutamicum stress, resistance, and tolerance (SRT) proteins given in AAB78871 to AAB79020.

The C. glutamicum SRT genes (I C) can be used in vectors (II) for carbor calls and production of fine chemicals, such as, an organic acid, a proteinogenic or nonproteinogenic anino acid (preferred), a purine or pytimidine base, a nucleoside, a nucleotide, a lipid, a saturated or unsaturated fatty acid, a diol, a carbohydrate, an aromatic compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine corporate production can be madulated. The presence of (I) or the SRT proteins (III) encoded by them are used for diagnosing the presence or activity of Corynebacterium diphtheriae. (I), (III) and host colls containing them can be used to map the genomes of organisms related to c. glutamicum, to identify and localise C. glutamicum sequences of interest, in evolutionary studies, in determination of SRT protein and in modulating the activity of an SRT pathway. (II) are used to permit cequions required for function, in modulating the SRT protein molecules and in modulating the activity of an SRT pathway. (II) are used to permit continuementally are chemically hazardous to it. (I) and protein molecules encoded by it increase the survival of C. glutamicum to chemical and environmental hazards and provide a means for continued growth and environmental hazards and provide a means for continued growth and continued growth rate or maintaining a normal growth rate in poor or toxic conditions, the yield, production and/or efficiency or production and continued stream conditions are conditioned growth and continued growth rate in poor or toxic orditions the yield or maintaining a normal growth rate in poor or continued proverses.
                                                                                                                                             Lee H;
                                                                                                                                                                                                                                                                                                             New isolated Corynebacterium glutamicum nucleic acid encoding a stress, tolerance or resistance protein, for production or modulation of production of fine chemicals, such as, e.g. amino acids, lipids,
